**Abstract:** To reveal the sequence characteristic and expression pattern of *Myf5* gene in Jiulong yaks (*Bos grunniens*), a full-length cDNA of *Myf5* was cloned from yak muscle tissue by RT-PCR. The cDNA obtained was 821bp nucleotide (nt) long with an ORF of 768 bp which encoding 255 amino acids. Compared with cattle, sheep, pig, horse, human, pygmy chimpanzee, mouse, rat and dog, the homology of amino acid sequences were higher (89-9%), but lower in Zebrafish (60%). SQ RT-PCR analysis showed that *Myf5* gene expression was observed only in longissimus muscle, but not be detected in heart, liver, kidney, spleen and adipose tissues. The expression level of *Myf5* gene in longissimus muscle of 0.5 and over 9 years old yaks was significantly higher than those of 3.5-5.5 years old yaks ( $p < 0.05$ ). These results suggest that *Myf5* may play an important role in the regulation of muscle growth and development of yak.

**Keywords:** Clone, *Myf5*, temporal expression, tissue expression, yak

## INTRODUCTION

With the improving gradually of people's living standard, people have higher demands on meat products and incline to protein-rich and fat-low meat. As a kind of all-purpose livestock, yak (*Bos grunniens*) inhabits steppes of the Himalayan highlands, which account for 95% in the world (Wiener *et al.*, 2003). Yak meat has long been prized for less pollution, unique flavors, low fat and cholesterol and high protein.

Muscle development is a complicated process regulated by many regulator factors. Myogenic Regulator Factors (MRFs) are important positively regulatory factors, which directly affect animal meat production and quality through regulating expression of key genes during the myogenesis process (Hughes and Schiaffino 1999; Rescan, 2001; Te Pas *et al.*, 2007). MRFs include MyoD, *Myf5*, myogenin and MRF4 and contain a conserved basic helix-loop-helix domain that binds the E box DNA motif (Buckingham, 1992; Dauncey and Gilmour, 1996). MyoD and *Myf5* are required for the specification and proliferation of myoblasts (Kablar *et al.*, 1999; Hughes and Schiaffino, 1999; Te Pas and Soumilion 2001; Wyzykowski *et al.*, 2002; Francetic and Li, 2011). MyoG and MRF4 mainly function during fusion of myoblasts into multinucleate myofibers in the animal (Wright *et al.*, 1989; Miner *et al.*, 1992; Hasty *et al.*, 1993; Patapoutian *et al.*, 1995). Knockout mouse experiments

revealed that MyoD and *Myf5* are critical importance to myogenesis process of mice (Rudnicki and Jaenisch, 1995; Tajbakhsh *et al.*, 1996; Wang *et al.*, 1996). Muroya *et al.* (2002) found that the *Myf5* expression in slow muscles was significantly higher than in fast muscles in adult cattle, which suggested *Myf5* gene maybe influence myofiber formation (Muroya *et al.*, 2002). *Myf5* gene was mapped at bovine chromosome 5 region (0 to 30 cM) which was identified as having significant associations with the growth traits (Li *et al.*, 2002; 2004). Association studies also found SNPs in *Myf5* significantly affected certain traits in different cattle breeds (Robakowska-Hyzorek *et al.*, 2010; Ujan *et al.*, 2011; Zhang *et al.*, 2007; Bhuiyan *et al.*, 2009). Because of its functions and support from the results of QTL and association studies, *Myf5* is considered as a candidate gene for growth related traits in meat producing animal species. In this study, the *Myf5* gene sequence of Jiulong yak was cloned and the *Myf5* expression profiles of Jiulong yak were analyzed in order to highlight the *Myf5* roles in the molecular basis of meat quality and growth in yaks.

## MATERIAL AND METHODS

**Animals and sample collection:** Healthy Jiulong yaks were slaughtered at 0.5 years, 3.5-5.5 years and 9 years old ( $n = 5$ ). Heart, liver, spleen, kidney, longissimus muscle and fat samples were harvested and frozen in

liquid nitrogen jars for total RNA extraction. Animal studies were approved by the Southwest University for Nationalities Institutional Committee for the Care and Use of Animals.

**DNA cloning of yak Myf5 gene:** Total RNA was isolated from the muscle tissues of Jiulong yak using Trizol (Invitrogen) according to the manufacturer's recommendations. The quality of RNA samples were detected by ultraviolet spectrophotometer. First strand cDNA was synthesized using M-MLV reverse transcriptase (Thermo) and used as the template for PCR. The PCR primers were designed based on bovine Myf5 mRNA sequence in GenBank (NM\_174116) as follows: F: 5'- ATGGACATGATGGACGGCTG -3' R: 5'-CTCCTTCCTCCTGTGTAATAGGC -3'. The PCR conditions were as follows: 94°C, 3 min, then 39 cycles of 30 s at 94°C, 35 s at 58.8°C, 1.0 min at 72°C; 7 min at 72°C. The PCR product was purified and cloned into pMD 18-T Vector (TaKaRa Biotechnology (Dalian) Co. Ltd.). Three positive clones were sequenced from both strands.

**Bioinformatics sequence analysis of Myf5 gene of Jiulong yak:** The Open Reading Frame (ORF) of Myf5 gene of Jiulong yak was identified using ORF Finder (<http://www.ncbi.nlm.nih.gov/gorf/gorf.html>). The isoelectric point and molecular weight of the protein deduced from the nucleotide sequence were analyzed by ExPASy (<http://www.expasy.org/tools>). The conservative domain was predicted by NCBI tools (<http://www.ncbi.nlm.nih.gov/Structure/cdd/wrpsb.cgi>) and the signal peptide of the protein was predicted by SignalP 4.0 (<http://www.cbs.dtu.dk/services/SignalP/>) (Petersen *et al.*, 2011). Amino acid sequence similarity analysis was performed by BLAST program (<http://blast.ncbi.nlm.nih.gov/Blast.cgi>) and BioEdit 5.0.6 (Hall, 2001); phylogenetic tree was constructed by MEGA 6.0 (Tamura *et al.*, 2013).

**Tissue expression of Myf5 gene of Jiulong yak:** Quantization of Myf5 mRNA level in different tissues of male yaks at ages of 3.5-5.5 yr (n = 5) were assessed by RT-PCR using  $\beta$ -actin as internal control. Total RNA and cDNA were prepared from heart, liver, kidney, spleen, Longissimus muscles and adipose

tissues of Jiulong yaks as mentioned above. The primers were designed according to Myf5 mRNA sequences of yak (KC184118). Myf5-F: 5'-CCATCCGCTACATTGAGAGTC-3', Myf5-R: 5'-GGGCTGTTACATTTCAG GCAT-3'. The  $\beta$ -actin primers were designed based on the sequence (BT030480).  $\beta$ -actin -F: 5'- CCCATCTA TGAGGG GTACGC-3',  $\beta$ -actin -R: 5'- CCTTGATGTCA CGGACGATTT -3'. Amplification was performed using the following cycling parameters: 94°C for 2 min, 33 cycles of 94°C for 30 s, 55.4°C for 30 s, 72°C for 30 s and 72°C for 1 min. After the reaction, PCR products were analyzed on 1.0% (w/v) agarose gels.

**Time-series expression of Myf5 gene in Longissimus muscles of Jiulong yak:** Fluorogenic quantitative PCR assay was developed for the quantization of Myf5 mRNA level in Longissimus muscles of male yaks at ages of 0.5 yr (n = 5), 3.5-5.5 yr (n = 5) and over 9.0 yr (n = 5). The primers for Myf5 and  $\beta$ -actin were the same as above. The amplification mixture contained 10 mL SYBR® Premix Ex Taq™ (2×) (TaKaRa Biotechnology (Dalian) Co., Ltd.), 1 mL of RT reaction mix, 0.5 mL of 10 mmol/L each of primers and add ddH<sub>2</sub>O to 20 mL. The PCR conditions were as follows: one cycle of 1 min at 95°C; 45 cycles of 30 s at 95°C, 30 s at 55°C, 30 s at 72°C. Each sample was run in duplicate.

**Statistical analysis:** Data were analyzed using SPSS17.0 and showed as mean±SEM. Differences were regarded as significant at p<0.05. The threshold cycle was analyzed using the  $2^{-\Delta\Delta C_t}$  method (Livak and Schmittgen, 2001).

## RESULTS AND DISCUSSION

The nucleotide sequence of cDNA of Jiulong yak Myf5 was 821 bp (GenBank accession No: KC184118) and contained an open reading frame of 768 nucleotides, encoding a predicted protein of 255 amino acids with classic BHLH domain and no signal peptide (Fig. 1 and 2). Compared to bovine Myf5 sequence (NP\_776541) (Table 1), Myf5 cDNA of Jiulong yak had four nucleotide differences resulting in an amino acid change. The deduced molecular weight was 28.26 KD and the theoretical pi was 5.72.

Fig.1: Prediction of biological function of the deduced amino acid sequence of Jiulong yak Myf5

Fig. 3: The alignment of Myf5 amino acid sequences from caprine and other species Fig.3. The GenBank accession numbers of the Myf5 sequences are listed in Table 1. Amino acid sequence alignment of yak Myf5 with the predicted Myf5 sequences from six other mammals. The sequence alignments were performed using BioEdit version 5.0.6.

Fig. 4: Phylogenetic tree of the amino acid sequences of Myf5 from yak and other mammals. The tree was constructed using the Neighbor Joining method in the MEGA version 6.0 software

Fig. 5: Tissue distribution of Myf5 in Jiulong yaks (n = 5). (A) Myf5 cDNA in six tissues. 1 Heart, 2 liver, 3 spleen, 4 kidney, 5 longissimus muscle, 6 adipose tissue. The Myf5 cDNA were obtained by semi-quantitative RT-PCR

Multiple sequence alignments of the deduced protein sequences of *Bos grunniens* Myf5 with other Myf5 sequences were shown in Fig. 3. *Bos grunniens* Myf5 was 99% identical to *Bos taurus*, *Ovis aries* and *Pantholops hodgsonii*, 97% identical to *Equus caballus*, 96% identical to *Sus scrofa*, 95% identical to *Homo sapiens* and *Pan paniscus* and 89% identical to *Mus musculus*. A phylogenetic tree to assess the relationship of yak Myf5 with other known Myf5 was performed (Fig. 4). The Myf5 protein largely clustered into two major groups. The yak Myf5 grouped together with

cattle as the closest neighbour, apart from Actinopterygii Myf5.

In male adult yaks (3.5-5.5 yr, n = 5), the highest level of Myf5 mRNA was observed in Longissimus muscles among tissues examined ( $p < 0.05$ ), but Myf5 mRNA expression could not be detected in heart, liver, kidney, spleen and adipose tissues (Fig. 5 and 6). Expressions of Myf5 gene in Longissimus dorsi of 0.5 yr male yaks were apparently highest. Longissimus dorsi of 3.5-5.5 yr yaks contained significantly lower level of Myf5 mRNA than those of 0.5 yr and over 9.0 yr yaks ( $p < 0.05$ ) (Fig. 7).

Fig. 6: The relatively levels of Myf5 mRNA in longissimus muscle of Jiulong yaks at different ages. The mRNA was detected by fluorescence quantitative PCR. Expression levels of Jiulong yak Myf5 gene in longissimus muscle at 0.5, 3.5-5.5 and 9 years old, respectively. Values without the same superscript are significantly different ( $P < 0.05$ ).

## CONCLUSION

In conclusion, we cloned Jiulong yak Myf5 gene and predicted the gene and deduced protein information. Furthermore, we analyzed the expression patterns of yak Myf5 and suggested that Myf5 may play an important role in the regulation of muscle growth and development of yak.

## ACKNOWLEDGMENT

This study was supported by the Fundamental Research Funds for the Central Universities, Southwest University for Nationalities (13NZYQN23), Innovation

Main expression of Myf5 mRNA in Longissimus dorsi suggested that Myf5 gene play important roles during muscle development of yak. This result is inconsistency with previous studies on other animals. Daubas *et al.* (2000) showed that Myf5 was detected in muscle tissues, it was also persisted in the adult brain of mouse. Timmons *et al.* (2007) made the striking discovery that brown preadipocytes demonstrate a myogenic transcriptional signature. Johansen and Overturf (2005) and Ye *et al.* (2007) revealed that expression differences of Myf5 gene in different tissues are great between fish and mammals. Expression level of Myf5 are highest in muscles of rainbow trout and sea perch and it also could detected in heart, kidney, spleen, brain and gill tissues. In this study, meanwhile, level of Myf5 mRNA in Longissimus dorsi of 0.5 yr and over 9 yr male yaks were significantly higher than that of 3.5-5.5 yr male yaks. This maybe suggested that Myf5 works at early and latter stages of development in yak. However further work is needed to resolve molecular mechanism of Myf5 gene in muscle development of yak.
